

CHOOSING TPCPIA OR TPCPI

The TPCPIA and TPCPI qualifications both cover strength testing, tightness testing and purging of commercial gas pipework but their scopes are different. The flowchart below will help you to choose which one you need.

Note 1: persons holding TPCPI are deemed to also hold TPCPIA.

Note 2: Maximum Incidental Pressure (MIP) is the highest pressure that can enter the system under fault conditions, e.g. after the failure of the mains regulator or a non-return valve upstream of a pressure-boosted section. This information can be obtained from the gas supplier or the designer of the pipework installation.
